Malware Analysis Report

Intern ID: 211

Intern Name: Rudra Rajendra Sawant

Malware Name: HW32.Packed

Malware Hash: c02153dce99eb8730806cfe19a3f29e3d4e3fad796f4eb15962b74fb2e55fe47

1. Overview

HW32.Packed is a generic detection name for executables that are compressed or encrypted using packers. These packers are often used to obfuscate the code of a malware sample, making it difficult to analyze statically. The term doesn't refer to one specific threat but to a class of suspiciously packed files, which may include trojans, ransomware, spyware, or backdoors.

2. Behavioral Characteristics

Obfuscation: Uses packers to compress or encrypt code.

Delayed Execution: Often includes techniques to delay execution, avoiding sandbox detection.

Anti-debugging: May include code to detect debugging tools and terminate.

Payload Delivery: Can be used to drop or unpack additional malicious files in memory or on disk.

Persistence: Might use registry entries, scheduled tasks, or startup folders to survive reboots.

3. Static Analysis

File Type: PE (Portable Executable)

Obfuscation Techniques: Likely uses custom or known packers like UPX, Themida, or others.

Imported Functions:

CreateProcess, WriteFile, LoadLibrary, VirtualAlloc, etc.

Indicators of Compromise (IOCs):

Hash: c02153dce99eb8730806cfe19a3f29e3d4e3fad796f4eb15962b74fb2e55fe47

Suspicious Sections: `.text`, `.rsrc`, `.UPX0`, `.UPX1`

4. Dynamic Analysis (Simulated/Expected)

Execution Behavior:

Spawns processes to inject code into legitimate services.

Attempts to connect to unknown IP addresses or command & control (C2) servers.

Might drop files in `%TEMP%` or `%APPDATA%`.

Network Behavior:

DNS requests to suspicious domains.

HTTP POST requests for data exfiltration.

5. Detection

VirusTotal Detections:

Detected by major antivirus engines as:

Generic Malware

Packed Executable

Suspicious Obfuscated File

Tools Used for Analysis:

Censys

Chaos

VirusTotal

Any.run (optional)

PEStudio, Hybrid Analysis

6. Mitigation & Remediation

Immediate Steps:

Quarantine the file.

Block network connections to C2 domains/IPs.

Run a full antivirus/malware scan on affected systems.

Prevention Tips:

Disable execution from temp folders.

Implement behavior-based detection (EDR).

User training on downloading unknown software.

[illegible]

The screenshot displays the Censys.io platform interface for the host 8.8.8.8. The search bar at the top shows the query "host.ip = '8.8.8.8'". The summary section includes reverse DNS (dns.google), forward DNS (www.collaborativedivorcetexas.net, cognito-auth.checkit.net, front-mkfl-main.catdohog.net, caringminds.net, bzioui.net, betkanyonvip.net, bb381.net, acpaff.net), and OS (No Data). The network and geolocation section shows WHOIS Network (Google LLC), WHOIS Organization (Google LLC), and Autonomous System (8.8.8.0/24 via GOOGLE, US (AS15169)). A map shows the location in Mountain View, United States (US) with coordinates 37.4056° N, -122.0775° W. The services section lists DNS 53 / UDP and HTTP 443 / TCP, both with details, raw data, and JSON options.

Service	Protocol	Last Observed	Details	Raw Data	JSON
DNS 53	UDP	FEB 21, 2025 20:28 UTC	DETAILS Server Type: FORWARDING Resolves Correctly: True R Code: SUCCESS		
HTTP 443	TCP	FEB 21, 2025 14:29 UTC			

8. Conclusion

HW32.Packed is a potentially dangerous malware classification that hides its actual payload using compression or encryption. While it may initially seem benign, unpacked versions often reveal serious threats. Hence, unpacking and sandboxing are critical for full threat assessment.
